Graphic recording The feature known as "graphic recording" allows the designer to record the user's actions, and then play those actions back to the user as the designer's preferred result. Graphic recording, along with a similar feature called "graphic scripting", is found in both AutoCAD and AutoCAD LT. Graphic recording uses the Microsoft Windows scripting engine to perform user-defined actions. Graphic recording allows users to define their own macros for a number of tasks, and has become the primary method of building AutoCAD feature libraries. Scripting for AutoCAD LT began in 1995 with the release of Release 9.0, and was enabled by the release of a tool, the UDL/LISP (User Definition Language/Lisp), to generate user-defined macros. UDL/LISP was initially released to provide a C++ bridge to the Autodesk Architectural Desktop product. Over time the scripting language was extended to support additional commands. For example, the command to snap to an alignment constraint was added in 1997. Scripting support continued to expand as new tools and features were added to AutoCAD, such as IFC drawing files, 2005 edition's DIMENSIONS and LAYERS and in 2007, command-line support. In 2006, the ObjectARX version of the script language was added. This was later expanded upon in 2009 when the USER-DEFINED COMMANDS feature of AutoCAD was introduced. This addition to the scripting language enabled user-defined commands that would have required writing a COM component to use in previous versions of AutoCAD. In 2010, the spreadsheet language, called Spreadsheet, was introduced with AutoCAD 2010. This is a more data-oriented approach to writing macro commands than UDL/LISP and ObjectARX, and allows users to apply macros to datasets instead of individual drawings. This was expanded in AutoCAD 2013 with Excel Services. This allows users to access spreadsheets stored on the web through the Internet, and write macros that operate on those spreadsheets. Spreadsheet's macro syntax is similar to Visual Basic for Applications, although there are some differences. Spreadsheet commands operate on data tables (also called "datasheets") rather than "datasets", which are the units of drawing storage. In 2011, graphics recording was extended to AutoCAD LT with the release of AutoCAD LT 2011. In 2013, graphic scripting a1d647c40b
