Understanding Photoshop functions Photoshop enables people to create and edit raster images. These images can be moved, manipulated or copied using Photoshop layers. They can be combined with one another or layers of different images. When that image has been arranged to match the style of an original image, it can be flattened to produce a copy of the original image. It can be saved in different image types. An image can be created using Photoshop's default appearance settings or it can be arranged using a selection tool and then modified using a drawing tool or with the Paint brush tool. The figure here demonstrates how to paint with the paint brush tool. The number of paint strokes, or dashes, makes up the weight of the paint. The Brush Size determines the size of the paint strokes. Drag a selection tool onto the layers and draw around the object you want to select. Select the object and then hit the Command key or click. Open the Tools palette. A selection box should appear around the object you want to select. Click on the Select All tool on the Tools palette. When the object is selected, a button that says Select appears on the selection tool. Use the Command key to cycle the selection tool through the different options. A little triangle appears to the left of the pointer when the mouse is over an object. Move the mouse over objects with this little triangle present and then press the Command key to toggle the options. When a layer is flattened, each item that was on that layer is now on one of the layers of the flattened image, or the background. Hold the Shift key to group several layers into a Group or select multiple layers. Merge the layers in the group into one larger layer by pressing the Ctrl key and the Alt key simultaneously. Press Ctrl+Tab to open the Organizer window. The Organizer window contains groups and various other organizational options. The Layers panel is a list of the currently selected layers. You can click on them to assign a layer to a channel, or color, in the History panel, shown above. The History panel shows which layer has been used in a previous image. There is a button to push to load a saved image into the history. The Paths panel holds the paths that have been drawn or edited. If you use the Move tool, you can use the Free Transform option to move these paths around on the

Q: Solved hint - Combinatorics not related question - Probability with Prior Conditional Probability This is not homework question. Find the Conditional Probability P(X | Y) P(Y), given the following - $P(X) = \frac{1}{4}$ $P(Y) = \frac{1}{2}$ Given P(X|Y), find P(X). So I started by writing down the formula for Conditional Probability as follows : $$P(X|Y) = \frac{P(X \cap Y)}{P(Y)}$$ where $X \cap Y$ is the intersection of X and Y. So, to find P(X|Y), I did the following: $$P(X|Y) = \frac{\frac{1}{4}\frac{1}{2}}{\frac{1}{2}} = \frac{1}{2}$$ Then, to find P(X), I did the following: $$P(X) = P(X|Y)P(Y) + P(X|\bar{Y})P(\bar{Y})$$ The two terms on the right are basically P(A) and P(B) where A is the event that Y is true, and B is the event that Y is false. So the answer from the book I am going through is $\frac{1}{8}$, but it isn't even close. Please help! P.S. I think I've tried every single part of the given equation, but I am unable to understand how to put them together into a solution. A: Recall that $X\cup Y=Y$ and $X\cap Y=\emptyset$. This implies that X and Y are disjoint, and that $P(X)=P(Y)=\frac{1}{2}$. The conditional probability can be rewritten as $P(X\mid Y)=P(Y\mid X)/P(Y)=\frac{P(X\cap Y)}{P(Y)}=\frac{\frac{1}{4}\frac{1}{2}}{\frac{1}{2}}=\frac{1}{2}$ Similarily, $
