Field of the Invention The present invention relates to an image pickup apparatus that controls an image pick-up operation of a camera to cause the camera to execute an image pick-up operation, and a control method for the image pickup apparatus, and, more particularly, to an image pickup apparatus and a control method for the image pickup apparatus which are capable of

preventing an erroneous image pick-up operation when a main switch of the camera is turned on in a state that a battery is charged in a secondary battery.

2. Description of the Related Art An image pickup apparatus generally has, for example, a controller that drives a body, an operability and an erroneous operation preventing function, and a CPU for controlling the body. To cause the image pickup apparatus to execute an image pick-up operation, the CPU controls the body through the controller. That is, as shown in FIG. 1, when a switch SW1 is turned on, for example, while a high-frequency signal is being supplied from a battery unit 2 to a control unit 4, which is connected to a CPU 3, the CPU 3 controls the body 5 so as to start an operation to implement a picking-up or a recording operation. However, in the prior art, when the battery unit 2 is connected to the control unit 4 in a state that the battery unit 2 is charged, even if the switch SW1 is turned on, the body 5 is not controlled to start the operation. The reason is as follows. When the switch SW1 is turned on and the battery unit 2 is connected to the

DNA sequence analysis of two components of the major heat-shock protein P1 of *Saccharomyces cerevisiae*. We have determined the nucleotide sequence of part of a major gene of the heat-shock protein P1 of yeast. The region sequenced codes for the NH₂-terminal half of the polypeptide. The identified gene codes for a protein of 201 amino acid residues of which the N-terminal amino acid sequence was determined by peptide mapping. The carboxyl-terminal of the protein as well as the coding region of the second gene of the gene family are unknown. The DNA sequence of the gene cloned in the yeast plasmid pBR327 was deduced from the amino acid sequence of the mature protein. The DNA sequence of this gene and some non-coding parts of the DNA sequence were also determined in the yeast plasmid pBR322 by a method described

here. The coding sequences of the two genes are identical, and the codons are the same as those of the corresponding amino acids. The possible function of this protein is discussed.

Q: How to wait until all tasks/handler method has been completed? I have a task which is waiting until the task has been completed, but I'd like to do the await for the method to complete.

```
public static class TaskHolder {  
    public static Task GetString() {  
        var t = Task.Run(async () => {  
            await Task.Delay(1000);  
            return "Hello";  
        });  
        return t;  
    }  
    public static async Task GetStringAsync()  
}
